this colourful textbook introduces students to conservation biology the science of preserving biodiversity

following the much acclaimed success of the first volume of key topics in conservation biology this entirely new second volume addresses an innovative array of key topics in contemporary conservation biology written by an internationally renowned team of authors key

topics in conservation biology 2 adds to the still topical foundations laid in the first volume published in 2007 by exploring a further 25 cutting edge issues in modern biodiversity conservation including controversial subjects such as setting conservation priorities balancing the focus on species and ecosystems and financial mechanisms to value biodiversity and pay for its conservation other chapters setting the framework for conservation address the sociology and philosophy of peoples relation with nature and its impact on health and such challenging practical issues as wildlife trade and conflict between people and carnivores as a new development this second volume of key topics includes chapters on major ecosystems such as forests islands and both fresh and marine waters along with case studies of the conservation of major taxa plants butterflies birds and mammals a further selection of topics consider how to safeguard the future through monitoring reserve planning corridors and connectivity together with approaches to reintroduction and re wilding along with managing wildlife disease a final chapter by the editors synthesises thinking on the relationship between biodiversity conservation and human development each topic is explored by a team of top international experts assembled to bring their own cross cutting knowledge to a penetrating synthesis of the issues from both theoretical and practical perspectives the interdisciplinary nature of biodiversity conservation is reflected throughout the book each essay examines the fundamental principles of the topic the methodologies involved and crucially the human dimension in this way key topics in conservation biology 2 like its sister volume key topics in conservation biology embraces issues from cutting edge ecological science to policy environmental economics governance ethics and the practical issues of implementation key topics in conservation biology 2 will like its sister volume be a valuable resource in universities and colleges government departments and conservation agencies it is aimed particularly at senior undergraduate and graduate students in conservation biology and wildlife management and wider ecological and environmental subjects and those taking masters degrees in any field relevant to conservation and the environment conservation practitioners policy makers and the wider general public eager to understand more about important environmental issues will also find this book invaluable

in the new edition of this highly successful book malcolm hunter and new co author james gibbs offer a thorough introduction to the fascinating and important field of conservation biology focusing on what can be done to maintain biodiversity through management of ecosystems and populations starting with a succinct look at conservation and biodiversity this book progresses to contend with some of the subject s most complex topics such as mass extinctions ecosystem degradation and over exploitation discusses social political and economic aspects of conservation biology thoroughly revised with over six hundred new references and web links to many of the organizations involved in conservation biology striking photographs and maps artwork from the book is available to instructors online at blackwellpublishing com hunter and by request on cd rom

we wrote this book to inspire the next generation of conservation biologists to help humans become better stewards of the world s biodiversity in doing so our desire was to fill two key gaps in the education of most conservation biologists that are beginning their studies this first gap is interdisciplinary training most textbooks of conservation and most university courses in conservation focus on the

discipline's historical roots in the natural sciences e.g. botany, ecology and disciplines of natural resource management e.g. forestry, fisheries, wildlife management but conservation is no longer a group of ecologists, wildlife biologists or fisheries scientists trying to save their favorite species in a dwindling habitat. The modern practice of conservation relies on numerous disciplines from the social sciences that account for human behaviors, values, needs and decision making. Modern conservation relies on disciplines from engineering and architecture to help plan, design and construct practical solutions to problems and finally modern conservation relies on disciplines from the humanities that compose law and policy and that communicate effectively through literature, art and photography. Numerous examples and exercises from these fields have been woven into this textbook to help improve interdisciplinary training. The second gap we see in the education of conservation professionals is skills based training. Over the past few decades many universities have eliminated course requirements in biology, chemistry, physics and math as demand for bachelor of science degrees has waned and demand for bachelor of arts programs has increased e.g. BAs in environmental sciences, earth science, conservation, ecology, etc. Many textbooks have been written to support BA programs that focus on giving students broad introductions to fields like conservation biology but few texts develop the depth of methods, tools and techniques that students will need to be successful practitioners in the field. We have carefully chosen the most important quantitative concepts, methods, tools, techniques and models that students need for a career in conservation and we explain those in simple terms while also providing the practice needed to master these new skills. Given our focus on more interdisciplinary skills based training, this book is written for aspiring conservation biologists who need more advanced training than is typically offered in an introductory level class. *Conservation Biology 2e* supports courses for upper division undergraduates who have already had some introduction to environmental science, ecology, wildlife biology, forestry or other fields related to conservation. This book can also be used for entry level graduate courses such as those in the growing number of professional master's programs that provide advanced degrees in environmental science, policy, management or sustainability.

This text is a broad introduction to ideas in ecology set in the context of global environmental change. The book incorporates case studies of conservation in practice written by a series of contributors, each an expert in their own field.

Reflecting a new generation of conservation biologists, upper division and graduate level conservation biology courses as well as for individual reference, this book incorporates a number of new authors and additional chapters covering all aspects of one of the most dynamic areas in the life sciences. Containing ten additional chapters, it includes such timely topics as ecosystem management and the economics of conservation.

This introductory textbook examines diminishing terrestrial and aquatic habitats in the tropics, covering a broad range of topics including the fate of the coral reefs, the impact of agriculture, urbanization and logging on habitat depletion and the effects of fire on plants and animal survival. It includes case studies and interviews with prominent conservation scientists to help situate key concepts in a real world

context covers a broad range of topics including the fate of the coral reefs the impact of agriculture urbanization and logging on habitat depletion and the effects of fire on plants and animal survival highlights conservation successes in the region and emphasizes the need to integrate social issues such as human hunger into a tangible conservation plan documents the current state of the field as it looks for ways to predict future outcomes and lessen human impact sodhi et al have done a masterful job of compiling a great deal of literature from around the tropical realm and they have laid out the book in a fruitful and straightforward manner i plan to use it as a reference and as supplemental reading for several courses and i would encourage others to do the same ecology 90 4 2009 pp 1144 1145

john harper nature conservation has changed from an idealistic philosophy to a serious technology ecology the science that underpins the technology of conservation is still too immature to provide all the wisdom that it must it is arguable that the desire to conserve nature will in itself force the discipline of ecology to identify fundamental problems in its scientific goals and methods in return ecologists may be able to offer some insights that make conservation more practicable harper 1987 the idea that nature species or communities is worth preserving rests on several fundamental arguments particularly the argument of nostalgia and the argument of human benefit and need nostalgia of course is a powerful emotion with some notable exceptions there is usually a feeling of dismay at a change in the status quo whether it be the loss of a place in the country for walking or rambling the loss of a painting or architectural monument or that one will never again have the chance to see a particular species of bird or plant

this primer is divided into five chapters focusing on biological diversity and its value the threats to biological diversity conservation at the population and species levels protecting and managing habitats and ecosystems and human societies and sustainable development case studies demonstrate the controversies in the field the choice of examples show the full range of species habitats and geographic areas of the world

conservation biology for all provides cutting edge but basic conservation science to a global readership a series of authoritative chapters have been written by the top names in conservation biology with the principal aim of disseminating cutting edge conservation knowledge as widely as possible important topics such as balancing conversion and human needs climate change conservation planning designing and analyzing conservation research ecosystem services endangered species management extinctions fire habitat loss and invasive species are covered numerous textboxes describing additional relevant material or case studies are also included the global biodiversity crisis is now unstoppable what can be saved in the developing world will require an educated constituency in both the developing and developed world habitat loss is particularly acute in developing countries which is of special concern because it tends to be these locations where the greatest species diversity and richest centres of endemism are to be found sadly developing world conservation scientists have found it difficult to access an authoritative textbook which is particularly ironic since it is these countries where the potential benefits of knowledge application are greatest there is now an urgent need to educate the next generation of

scientists in developing countries so that they are in a better position to protect their natural resources

this is the first introductory text on conservation biology to focus clearly on southern australia and the problems that face its native animals and plants and their habitats as a result of human interference beginning with a comprehensive discussion of the broad principles of conservation biology and its importance in australia conservation biology covers the development of conservation practice and theory in australia using local examples to provide a framework for understanding the extent and nature of the need for conservation in southern australia extinction and its significance the meanings levels and interpretation of the concept of biodiversity the notion of rarity and its evaluation in terms of establishing the conservation status of flora and fauna approaches to species and ecosystem conservation including reserve design and setting priorities for conservation management conservation beyond reserves and ex situ conservation encompassing captive breeding and reintroduction the considerable number of threats to species and ecosystems australia s conservation responsibilities in a global context conservation biology features a series of topical case histories that highlight management issues and some of the successes and disappointments that have occurred and each chapter includes suggestions for further reading

this volume combines theory with applied and basic research to explain the connections between conservation biology and environmental economics ethics law and the social sciences it stresses the need for theory research and an interdisciplinary approach in solving conservation problems

this book provides a thorough up to date examination of conservation biology and the many supporting disciplines that comprise conservation science in this the third edition of the highly successful conservation biology foundations concepts applications the authors address their interdisciplinary topic as it must now be practiced and perceived in the modern world beginning with a concise review of the history of conservation the authors go on to explore the interplay of conservation with genetics demography habitat and landscape aquatic environments and ecosystem management and the relationship of all these disciplines to ethics economics law and policy an entirely new chapter the anthropocene conservation in a human dominated nature breaks new ground in its exploration of how conservation can be practiced in anthropogenic biomes novel ecosystems and urban habitats the third edition includes the popular points of engagement discussion questions used in earlier editions and adds a new feature information boxes which briefly recap specific case histories described in the text a concluding chapter offers insight into how to become a conservation professional in both traditional and non traditional roles the authors fred van dyke and rachel lamb draw on their expertise as field biologists wildlife managers consultants to government and industry and scholars of environmental law policy and advocacy as well as their many years of effective teaching experience informed by practical knowledge and acquired skills the authors have created a work of exceptional clarity and readability which encompasses both systemic foundations as well as contemporary developments in the field conservation biology

this edited book composed of chapters written by scholars of the environmental and biological sciences examines selected topics from the vast field of conservation biology with a focus on some of the issues that dominate the current discourses and practices on the conservation biology of large wildlife the first chapter examines the history and status of conservation biology and examines the status of large wildlife in conservation biology research the second chapter examines the issues related to urban forestry and conservation justified by the vast expansion of urban landcover into the habitats of large wildlife and the consequences for people and animals chapters three and four focus on big cats in the americas and apply ideas from the theory of conservation biology to assess their conservation possibilities chapter five examines the land cover conflicts that occur between people and animals when transportation networks intrude on habitats chapter six looks at the nuances of governance and the impact on conservation policy chapter seven describes the value of integrated research and geomatics in the applications to protected management chapter eight takes a novel total ecosystem approach by examining micro and meso fauna and their function in ecosystems inclusive of macro fauna chapter nine takes a case study of vultures which are the most important scavengers in the world and examines the impacts of recent diseases that severely decimated their numbers chapter ten takes a case study of a unique savanna area on the forested west african coast and investigates the ecology of the area and the factors for the extinction of large wildlife

the main goal of this book is to encourage and formalize the infusion of evolutionary thinking into mainstream conservation biology it reviews the evolutionary foundations of conservation issues and unifies conceptual and empirical advances in evolutionary conservation biology the book can be used either as a primary textbook or as a supplementary reading in an advanced undergraduate or graduate

level course likely to be called conservation biology or in some cases evolutionary ecology the focus of chapters is on current concepts in evolution as they pertain to conservation and the empirical study of these concepts the balanced treatment avoids exhaustive reviews and overlapping duplication among the chapters little background in genetics is assumed of the reader
